Favorites

One-tap bookmarking with optimistic UI and engagement signal generation

Category: **Engagement** | Server: **POST /favorites/{id}/toggle** | Status: **Production**

1 round-trip Toggle	Yes Optimistic UI	Backend unique Dedup	15 Page size
-------------------------------	-----------------------------	--------------------------------	------------------------

1. What it is

Favorites let any signed-in user bookmark a listing and revisit it later. The heart icon appears on every listing card, the home grid, the search result row and the detail screen. Toggle is one POST and is mirrored locally for instant feedback.

2. How it works

01 User taps heart 1	Card optimistically flips its icon state immediately.
02 API call 2	POST /api/favorites/{id}/toggle returns added: bool.
03 Reconcile 3	If the API disagrees (e.g. server already has it), the icon snaps back.
04 Favorites tab 4	GET /api/favorites paginates the user's saved listings.

3. Capabilities

Capability	What it does
One-tap toggle	Single endpoint adds or removes; the response tells the UI which one happened.
Optimistic UI	Toggling a card never blocks; the network call is fire-and-forget with reconciliation.
Favorites screen	Paginated list of saved listings, with pull-to-refresh.
Per-user uniqueness	Backend enforces unique (user_id, listing_id) so heart spam is safe.
Soft cascade	If a listing is deleted, the favorite is removed by the ListingObserver.

4. Investor relevance

WHY IT MATTERS

Favorites are the cheapest possible engagement signal. They power re-engagement push notifications, and they let us identify the most-saved listings in a region for premium placements.

5. API

```
POST /api/favorites/{id}/toggle -> { added: true|false }  
GET /api/favorites?page=1 -> paged saved listings  
POST /api/favorites/{id} -> explicit add  
DELETE /api/favorites/{id} -> explicit remove
```
