

KYC Verification

KYC Verification

Mandatory identity verification that powers trust, gating and premium tiers

Category: Trust & Safety | Server: POST /kyc | Status: Production

ID / Passport Documents	Front + Back + Selfie Captures	Admin queue Review	On reject Resubmit
-----------------------------------	--	------------------------------	------------------------------

1. What it is

KYC (Know Your Customer) is the trust layer. Sellers who want to publish listings or unlock contact reveals must upload a government-issued ID and a selfie. The admin team reviews submissions and approves / rejects with a reason. KYC status is exposed in the user profile and gates listing creation in higher tiers.

2. How it works

01 Open KYC screen 1	App calls GET /api/kyc/status to show current state (none, pending, approved, rejected).
02 Capture 2	User captures front of ID, back of ID (for national_id) and a selfie with the document.
03 Submit 3	POST /api/kyc with multipart FormData (front_image, back_image?, selfie_image).
04 Admin review 4	Admin portal queues the submission, inspects images, approves or rejects with reason.
05 Status reflects 5	App polls status; rejection reason is shown to the user with a 'Resubmit' button.

3. Capabilities

Capability	What it does
Document types	National ID and Passport are supported; passport skips the back image.
Image capture	Camera + gallery pickers, image_cropper for ID alignment.
Selfie check	Selfie-with-document helps admins confirm the applicant owns the ID.

Status tracking	none, pending, approved, rejected with rejection reason surfaced in-app.
Resubmission	On rejection, the user can fix and resubmit; previous attempts are versioned on the backend.
Admin queue	KYC submissions appear in the admin dashboard for moderation.
Gating	Server middleware kyc.subscription enforces KYC for sensitive endpoints.

4. Investor relevance

WHY IT MATTERS

KYC is WaveMart's competitive moat. Ethiopian classifieds are full of fraud; by making identity verification mandatory for sellers, we create a safer, more professional marketplace - and we earn the right to charge premium subscriptions to verified users.

5. API

```
GET /api/kyc/status -> { status, is_verified, document_type, rejection_reason, ... }
GET /api/kyc/create -> form metadata (document types, requirements)
POST /api/kyc multipart: front_image, back_image?, selfie_image, document_type
```
