Subscriptions & Plans

Tiered SaaS plans with capability flags, usage counters and a discount engine

Category: **Monetization** | Server: **/api/subscriptions** | Status: **Production**

4 Plan tiers	5 levels Details access	8 Capability flags	Upgrade rules Discount engine
------------------------	-----------------------------------	------------------------------	---

1. What it is

Subscriptions are WaveMart's primary monetization rail. A user picks a plan (Free, Basic, Premium, Professional) and instantly unlocks a set of capability flags. The same response carries the user's current plan, usage counters and per-plan discount rules so the UI can show upgrade savings in real time.

2. Plan tiers

Plan	Highlights
Free	1 active listing, discovery only (no video, no contact, no VIP), 0 orders, 0 contacts/month
Basic	Multiple listings, listing detail without video or contact, no VIP view, capped contacts
Premium	Higher quotas, no-video detail, see VIP, more orders, more contacts
Professional	Unlimited listings, full detail access including video and contact, VIP view, highest quotas

3. Capabilities exposed to the app

Flag	Meaning
can_create_listing	Sellers can publish new listings
can_feature_listing	Promote a listing to Featured
can_view_vip	See the VIP carousel and VIP-only listings
can_create_order	Buyers can publish 'find me a property' orders
can_see_video	Listing detail shows the video tab
can_see_contact	Listing detail shows the seller contact

contact_views_used	Counter for the current billing period
contact_views_remaining	Counter for the current billing period

4. Discount engine

When a user considers an upgrade, the backend inspects the **discount_rules** table and returns a **price_info** object with original price, discounted price, percentage and rule type. The Flutter plan card shows a strikethrough price and a 'Save X%' badge when an upgrade discount applies.

5. How it works

01 Plans loaded 1	GET /api/subscriptions -> plans[] + current_subscription + all capability flags.
02 Subscribe 2	GET /api/subscriptions/{plan}/subscribe returns checkout_url or free activation.
03 Initiate payment 3	POST /api/subscriptions/{plan}/initiate-payment returns tx_ref (Chapa).
04 Pay 4	Chapa WebView collects Telebirr / CBE Birr / card / wallet.
05 Activate 5	GET /api/subscriptions/activate?tx_ref=... activates entitlements on success.
06 Free plans 6	If price=0, the subscription is activated in step 3 with no payment round-trip.

6. Investor relevance

WHY IT MATTERS

Subscriptions turn a free marketplace into a SaaS business. The capability flag system means we can ship new gated features (e.g. AI valuations) without app updates - just flip a flag in the plan.

7. API

```
GET /api/subscriptions plans + current sub + flags
GET /api/subscriptions/{plan}/subscribe free activation or checkout_url
POST /api/subscriptions/{plan}/initiate-payment returns tx_ref
POST /api/subscriptions/{plan}/process-payment processes callback payload
GET /api/subscriptions/activate?tx_ref= activate after Chapa callback
```
