|-----------------------------|------------------------|-------------------------|-------------------|

## 1. What it is

An Order is a buyer's 'I am looking for X' request. It captures type (house / land), intent (sale / rent), holding, facing direction, budget range, area range, location and a free-form description. The backend **OrderMatchingService** then automatically generates Lead suggestions by matching active listings against the order's criteria.

## 2. How it works

|                       |                                                                                |
|-----------------------|--------------------------------------------------------------------------------|
| 01 Create order 1     | Buyer fills a multi-step form (similar to listings) and POSTs to /api/orders.  |
| 02 Server matches 2   | OrderMatchingService scans active listings and creates 'suggestion' leads.     |
| 03 Buyer reviews 3    | GET /api/orders/{id}/suggestions returns the matched listings as Lead objects. |
| 04 Accept / decline 4 | PATCH /api/orders/suggestions/{id}/accept decline updates the lead stage.      |
| 05 Cancel 5           | DELETE /api/orders/{id} cancels the order (and any open suggestion leads).     |

## 3. Capabilities

| Capability             | What it does                                                                           |
|------------------------|----------------------------------------------------------------------------------------|
| Multi-step create      | Type -> Holding -> Use -> Location -> Details -> Review, mirroring the listing wizard. |
| Budget and area ranges | Optional min/max for price and square meters.                                          |
| Address-aware          | Same Region / Zone / Woreda / Kebele cascading dropdowns.                              |

|                               |                                                             |
|-------------------------------|-------------------------------------------------------------|
| <b>Automated matching</b>     | Server creates suggestion leads on save.                    |
| <b>Lead stages</b>            | new, contacted, negotiating, offer, won, lost.              |
| <b>Per-suggestion actions</b> | Accept or decline each matched listing individually.        |
| <b>Inbox integration</b>      | My Interests and Order Suggestions feed lead management UI. |
| <b>Soft delete</b>            | Cancelled orders stay in history for analytics.             |

## 4. Investor relevance

### WHY IT MATTERS

Orders invert the marketplace. Instead of waiting for buyers, sellers receive qualified, pre-filtered demand - essentially a CRM for real estate. This is the foundation for our future 'WaveMart Pro' agent product, where agencies pay to receive hot leads.

## 5. Tech surface

| Component              | Location                                                          |
|------------------------|-------------------------------------------------------------------|
