

Help Center & Support

Help Center & Support

Knowledge base, full-text search and a ticketing system with CSAT ratings

Category: **Support** | Server: `/api/help` | Status: **Production**

Dynamic Categories	Markdown / HTML Articles	Full thread Tickets	Article + ticket Feedback
------------------------------	------------------------------------	-------------------------------	-------------------------------------

1. What it is

The Help Center is a self-service knowledge base and ticket system. Articles are organized in categories, full-text searchable and rateable. If a user cannot find an answer, they can open a ticket and chat with the support team, rate the resolution and attach feedback.

2. How it works

01 Browse categories 1	GET <code>/api/help</code> -> categories with article counts.
02 Read article 2	GET <code>/api/help/article/{slug}</code> returns the article body and lets the user vote helpful / not.
03 Search 3	GET <code>/api/help/search?q=...</code> is a fast full-text search.
04 Open ticket 4	POST <code>/api/help/tickets</code> creates a ticket with the user's issue.
05 Converse 5	GET <code>/api/help/tickets/{number}</code> fetches the thread; POST <code>.../message</code> adds a reply.
06 Rate 6	POST <code>/api/help/tickets/{number}/rate</code> rates the resolution.

3. Capabilities

Capability	What it does
Category tree	Categories fetched from the backend; new articles can be added without an app release.
Article reading	Clean article view with helpful / not helpful voting.
Full-text search	GET <code>/api/help/search</code> covers titles and bodies.
Ticketing	Open, list, view and reply to tickets.

Rating	End-of-conversation CSAT collected inline.
Localized	Article content respects the active locale.

4. Investor relevance

WHY IT MATTERS

Good support is the cost of doing business in real estate. The help center turns that cost into a self-serve asset that deflects tickets and improves SEO.

5. API

```
GET /api/help categories
GET /api/help/category/{slug} category articles
GET /api/help/article/{slug} article + vote
GET /api/help/search?q= full-text
GET /api/help/tickets my tickets
POST /api/help/tickets open ticket
GET /api/help/tickets/{number} thread
POST /api/help/tickets/{number}/message reply
POST /api/help/tickets/{number}/rate rate
```
